

Abnormal air temperature of air-cooled generator

What is a good air temp for a generator?

For a generator, the internal inlet air temperature is typically 35-40 degrees Celsius higher than the ambient temperature. This is known as the Overdesign Temperature Rise (ODP). The generator does not require any de-rating for single-wall applications with typical cooling water temperatures of 32 degrees Celsius.

What causes aging in a generator?

Insulation aging in large generators is one of critical fault sources for machines. About 1/3 of generator faults are caused by critical temperature under stator winding insulation faults, especially stator ground-wall insulation shelling fault.

What happens if a generator is oversized?

For a typical 20°C rise over ambient for the internal cooling circuit,an example of internal air temperature would be 40°C ambient +30°C = 70°C. The ambient air temp remains constant, and the generator needs 35-40% over-sizing to equal an ODP (Overall Design Point). This generator has cooling water inlet and outlets (TEAWC,CACW).

How much incoming air does a generator need?

A generator typically needs 35-40% over-sizing the incoming air based on the internal generator inlet air temperature being ambient +20 degrees Celsius. For typical 32 degrees Celsius water, there is no de-rate for single-wall application. The generator requires this amount of air for cooling purposes. For example, for every kilowatt of loss, the required flow is 1 gallon per minute.

What causes a radiator to Oole?

ooled by fans pushing airthrough a radiator, remote or engine mounted. The higher the ambient temperat re the greater the amount of air flow through the radiator is required. When the ambient temperature rises above that calculated for NTP the maximum power from the engine has to be lowered to avoid over-h

How does thermal analysis affect the aging of a hydro generator?

C. Hatiegan presented the modeling and simulation of the thermal analysis on the stator winding of the hydro generator. Once the temperature of the insulating material was increased, many molecules of the insulation produced chemical reactions accelerating the insulation aging.
