How does a microgrid work?

When the price of utility power peaks under high demand, the microgrid can automatically switch your loads to on-site energy instead. If excess power is generated or stored on the microgrid, you can participate in demand response programs by selling energy to the utility, easing overall demand on the grid. 10.

Are microgrids self-contained?

But because microgrids are self-contained, they may operate in "island mode," meaning they function autonomously and deliver power on their own. They usually are comprised of several types of distributed energy resources (DERs), such as solar panels, wind turbines, fuel cells and energy storage systems.

Should a microgrid be integrated with a utility grid?

To do this seamlessly, the microgrid should be integrated with the utility's automation systems at the substation and distribution levels. By connecting a microgrid to the utility grid as a DER, you can help increase the role of renewables on the grid and improve grid resilience.

What are the components of a microgrid?

A variety of energy technologies connect to create a microgrid. Each consists of several key components: These are the generators that produce electricity for the microgrid. They can include renewable sources like solar panels, wind turbines, and hydroelectric systems, as well as non-renewable sources like diesel or natural gas generators.

Why should you invest in a microgrid?

Enterprises are more motivated than ever to control energy costs and increase sustainability, while the utility grids they rely on grow more vulnerable due to aging infrastructure, extreme weather, and rising energy demand. A microgrid can help your organization achieve its goals and control its energy future- with or without capital investment.

Can a microgrid reduce energy costs?

This can result in lower energy costs; for example, Pittsburgh International Airport's switch to a solar and natural gas microgrid led to a reported USD 1 million in savings in its first year. 2 And a California winery built a microgrid around photovoltaic (PV) solar energy that reduced its monthly energy bills from USD 15,000 to USD 1,000. 3
