

Aurora grid Peru

What is the Aurora vulnerability?

This vulnerability is referred to as the Aurora Vulnerability. This vulnerability is especially a concern because most grid equipment supports using Modbus and other legacy communications protocols that were designed without security in mind. As such, they do not support authentication, confidentiality, or replay protection.

What are Aurora hardware mitigation devices?

Existing protection will address "slower" developing faults and off nominal grid frequencies ($\pm 59\text{ Hz}$ or $\pm 61\text{ Hz}$). The Aurora hardware mitigation devices are for the very fast out-of-phase condition faults that are currently gaps in protection (i.e., not protected by any other device) of the grid.

How does an Aurora attack work?

The Aurora attack is designed to open a circuit breaker, wait for the system or generator to slip out of synchronism, and reclose the breaker, all before the protection system recognizes and responds to the attack... Traditional generator protection elements typically actuate and block reclosing in about 15 cycles.

Did Aurora mislead utilities?

Joe Weiss, a cybersecurity and control system professional, disputed the findings from this report and claimed that it has misled utilities. He wrote: "This report has done a great deal of damage by implying that the Aurora mitigation devices will cause grid issues."
