

Where is Bouvet Island?

Bouvet Island (/ˈbuːveɪ /BOO-vay; Norwegian: Bouvetøya [bʊˈvɛːoe]) is an uninhabited island and dependency of Norway. It is a protected nature reserve. It is a subantarctic volcanic island, situated in the South Atlantic Ocean at the southern end of the Mid-Atlantic Ridge, and is the world's most remote island.

How big is Bouvet Island?

Bouvet Island (called Bouvetøya in Norwegian) is 49 square kilometers in area. About a quarter of this is taken up by a caldera, called Wilhelmplataet. The highest point of the island is on the caldera rim, Olavtoppen, at 780 meters; it was climbed for the first time only in 2012. The ice-filled caldera itself is 250 meters below the rim.

Is Bouvet a volcano?

All deep-ocean islands are volcanic in nature. And because islands erode pretty fast, they tend to be younger volcanoes which are still active or slightly dormant. Bouvet is a shield volcano in the final stage of its life above water. The caldera shows that there have been significant eruptions in the past!

Does Bouvet Island have ice?

Ice covers about 94 percent of Bouvet Island year-round. Bouvet Island has little to offer. The most remote island in the world is fewer than 20 square miles in size, and it's almost entirely covered by a glacier. Long ago, it was an active volcano, but those fiery days have long since passed.

Does Bouvet Island have a top-level domain?

But here's the weird thing about Bouvet Island having its own top-level domain: It's uninhabited. It's always been uninhabited. Located in the southern Atlantic, the closest land to Bouvet Island is the coast of Antarctica, 1,100 miles to the south.

How did Bouvet Island become a dependency?

The expedition carried out aerial photography of the island and was the first Antarctic expedition to use aircraft. : 64 The Dependency Act, passed by the Parliament of Norway on 27 February 1930, established Bouvet Island as a Norwegian dependency, along with Peter I Island and Queen Maud Land.
