

Central African Republic microturbine power generation

How many people have access to electricity in Central African Republic?

Less than 3% of the population has access to electricity in Central African Republic. Grid-based electricity supply is insufficient to meet electricity demand: it is unavailable 28% of the year on average, mainly due to generation outages.

What are the economic benefits of microturbine with new combustor?

The economic benefits are given for the microturbine with new combustor. The ever-increasing demand on highly efficient decentralized power generation with low CO₂ emission has made microturbines for power generation in micro gas turbine (MGT) systems popular when running on biofuels as a renewable source of energy.

Can a microturbine combustor be used as a primary energy source?

The combustion of diesel and natural gas fuel is also examined compared with the investigated renewable fuel to show the flexibility of the microturbine combustor as well as its prospective advantages by using renewable fuel as the primary energy source.

When was a microturbine invented?

The design and development of both small stationary and automotive gas-turbines began on 1950's which now eventuate into the two types of today's modern MGT. In developing the microturbine for power generation, considerable attention has been paid to improving the combustor.

How efficient is a microturbine?

The results gave on average 46.7% electrical efficiency, 83.2% system efficiency, 12 kW_e electrical power, and 90% recuperator effectiveness at nominal operating conditions of microturbine (MT).

Which microturbine parts are mainly responsible for exergy destruction and losses?

Microturbine parts mainly responsible for exergy destruction and losses are combustion chamber and recuperator. The exergy losses from these two components are mutually related which could be minimized with a good system optimization approach.

This will consist in ensuring base power generation mainly from hydro-richest countries such as Democratic Republic of Congo (DRC) and Cameroon and, providing the required flexibility for the integration of wind and solar energy [32, 33] available in abundance in countries such as Chad, Central African Republic (CAR) and also Cameroon [34, 35].

Micro turbines are generally regulated by varying the fuel supply. The electrical efficiency of micro turbines is typically 15-30%; the higher range efficiencies are obtained with pre-heated combustion air (Chambers and

Rankine Microturbine. A Rankine steam turbine power plant-on-a-chip for power generation from waste heat is also under development . The device design consists of 4 mm rotors with multistage microturbines, magnetic generators, and a spiral groove viscous micropump, integrated with two-phase flow microchannel evaporators and condensers.

Gas turbines play a critical role in power generation, converting natural gas or other fuels into mechanical energy, which drives electrical generators. Their ability to generate electricity quickly, with higher efficiency and lower emissions compared to coal-based systems, makes them essential in both standalone and combined-cycle power plants

From (), we can see the frequency of the stator's induced voltage is $(\frac{\omega_r}{2\pi})$, which is very high as the single-shaft micro-turbine rotates usually at 45, 000-120, 000 RPM. The frequency of the induced voltage depends on the turbine's speed. One rotation generates one sine wave in a two-pole machine. Equation shows the RPM calculation, ...
