

How to remove the generator rotor blades

How do you remove a rotor from a generator?

Insert a metal rod or a large screwdriver through the starter pulley to lock the rotor axle in place. Insert the rotor puller tool into the rotor axle. Hand-tighten the puller tool onto the rotor threads. Use a 19 mm socket to tighten the puller tool until it breaks the rotor free from the generator assembly.

How do I remove a stator rotor?

Stator only Removal: When removing only the stator with rotor, you will not remove the engine. You must disconnect the harness wires at the terminal block, remove the brush set, remove the AVR, and remove the 2 green wires on the diode assembly.

How do you replace a rotor on a motorcycle?

After breaking the rotor free from the engine, you can now remove the engine from the chassis in one piece and replace the rotor. Note: By using a motorcycle-type tie down strap attached to the upper frame tubes, you can cradle the stator while the rotor and the engine are removed.

How do you remove a stator from a generator?

Rotate the stator cover so that the seam is at an accessible angle. Use a flathead screwdriver to pry up the tabs holding the stator cover together. Remove the stator cover. Remove the stator by pulling it straight out of the generator assembly. During reassembly, you don't need to install the stator in a precise rotational position.

How do you tighten a generator rotor bolt?

A light lubricant, oil, or grease on the end of the crank will assist in centering during the tightening of the rotor securing bolt. Using the 2 1/2 bolt, wrap the Teflon tape on the threads of the bolt and put the generator in an uphill position. Fill the rotor bolt cavity with standard motor oil, do not exceed 40 weight.

Do I need a Honda rotor puller tool?

Warning: You need a Honda rotor puller tool (07HPC-ZC2010A or 07HPC-ZC2010B) in order to complete this procedure. You will not be able to remove the rotor without this tool. This procedure shows how to complete the procedure without removing the generator from the frame.

For dismantling the turbine shell, all the locking bolts are removed. All the shrouds and nozzle segments are pinned with the turbine shell. For getting access to the pins, bolts are first removed. Pins are internally threaded and removed by a ...

The load shaft should be hanged with the lever hoist and pushed with the jacking bolts towards the Generator end. So that, rabbit of the turbine rotor flange will be free. ... The turbine rotor buckets are first numbered before removal. The first ...

When dealing with a wind turbine generator and different wind turbine rotor blade designs, the term "tip-speed ratio" (TSR) is often used instead of blade rpm.. Wind turbine rotor blades can potentially rotate at very high speeds. The tip ...

Removing a rotor from a large industrial generator Weighing over 45,000 lbs. with a slim margin of error of only 3/4" in radial clearance, watch the Smith Services team use a custom 20" long steel tube with a 1" wall thickness, weighing ...

The rotor is the rotating part of the generator, typically made of a magnet or coil windings. It is responsible for creating a rotating magnetic field that interacts with the stator to induce ...

ment, such as at blade-tip and angel-wing locations. Wear also results from prolonged slow rolling of the turbine rotor on turning gear. So-called "blade rock" is caused by an increase in clear ...

This guide shows how to remove and replace the rotor for the Honda 6500 Watt Generator EG6500CL AT. Warning: You need a Honda rotor puller tool (07HPC-ZC2010A or 07HPC-ZC2010B) in order to complete this procedure. You will ...
