What are the benefits of microgrids?

A microgrid can lower energy costs for consumers and businesses. Microgrids can both reduce costs and provide a revenue stream for their customers. They reduce costs through the efficient management of energy supply. They supply revenue by selling energy and services back to the grid. This gives consumers a new kind of control in energy markets.

Are microgrids a good investment?

However, the potential benefits of microgrids, including flexibility, resiliency and efficiency, make them appealing to many businesses and communities seeking new energy management systems. In fact, investment in microgrids is growing, with one report suggesting the global market for them could grow to USD 55 billion by 2032. 4

How can microgrids improve energy access?

Improved Energy Access: Microgrids can provide energy access to remote or underserved communities that are not connected to the traditional power grid. This can improve the quality of life for residents and increase economic opportunities in these areas.

Can microgrids improve energy resilience?

Since microgrids are not the only way to enhance energy resilience, communities may want to consider alternate resilience investment options, including hardening existing transmission and distribution systems, weatherizing power generation sources, and building additional distribution systems to provide energy supply redundancy.

What are microgrids & how do they work?

One way to achieve this is through the use of microgrids, which are small-scale power systems that can operate independently from the traditional grid. They allow communities, businesses, and even households to generate, store, and distribute their own energy, reducing dependence on fossil fuels and the traditional power grid.

Can a microgrid reduce energy costs?

This can result in lower energy costs; for example, Pittsburgh International Airport's switch to a solar and natural gas microgrid led to a reported USD 1 million in savings in its first year. 2 And a California winery built a microgrid around photovoltaic (PV) solar energy that reduced its monthly energy bills from USD 15,000 to USD 1,000. 3
