What are the latest advances in thermal energy storage systems?

This review highlights the latest advancements in thermal energy storage systems for renewable energy, examining key technological breakthroughs in phase change materials (PCMs), sensible thermal storage, and hybrid storage systems. Practical applications in managing solar and wind energy in residential and industrial settings are analyzed.

Are hybrid nano-enhanced phase-change materials suitable for thermal energy storage?

The disparity between the supply and demand for thermal energy has encouraged scientists to develop effective thermal energy storage (TES) technologies. In this regard, hybrid nano-enhanced phase-change materials (HNePCMs) are integrated into a square enclosure for TES system analysis.

Are hnepcms effective thermal energy storage materials?

Thus, HNePCMs are demonstrated to be more efficient materials and are emerging as potential materials to augment the performance of TES applications. The authors declare no conflict of interest. The disparity between the supply and demand for thermal energy has encouraged scientists to develop effective thermal energy storage (TES) technologies.

What is a thermal energy storage system (PCM)?

In thermal energy storage systems, PCMs are essential for storing energy during high renewable energy generation periods, such as solar and wind. This energy storage capability allows for more efficient supply and demand management, enhancing grid stability and supporting the integration of renewable energy sources.

What is a thermal energy storage system?

By heating (or cooling) a storage medium, thermal energy storage systems (TES) store heat (or cold). As a result, further energy supply is not required, and the overall energy efficiency is increased. In most cases, the stored heat is a by-product or waste heat from an industrial process, or a primary source of renewable heat from the sun.

How many thermal energy storage items are there in 2024?

The number of items has progressively increased from 6 in 2019 and 2021 to 14 in 2024, indicating growing scholarly attention and advancements in thermal energy storage systems and materials for renewable energy applications. Figure 5 b shows the distribution of items by journal.
