How can South Sudan's energy sector support peacebuilding?

One possibility for South Sudan's electricity sector is to work with the energy transition objectives of the United Nations (UN) Secretariat, which present new and unique opportunities to unlock a series of clean energy projects across the country. This approach is also a creative way to support peacebuilding.

Why is energy infrastructure underdeveloped in South Sudan?

Partly due to the civil wars (e.g., 1955-1972, 1983-2005 & 2013-present), energy infrastructure remains very underdeveloped in South Sudan. Despite a peace agreement in 2015, which has been revitalized recently, conflict has impeded the country's effort in transitioning to renewable energy.

Should subsidies be removed for solar & wind energy in South Sudan?

Subsidies have been crucial in the development of any energy sources, including oil and coal in the early stages of development. So, removing subsidies particularly on fuel for generators would level the investment ground for solar and wind energy in South Sudan.

How much solar energy does South Sudan have?

South Sudan receives about 8 hours of sunshine daily, providing an estimated solar energy capacity of 436 W/M²/year (REEP, 2013). Similarly, wind energy density ranges between 285 and 380 W/M² (REEP, 2013). Both the solar sunshine duration and wind density meet the threshold required to produce high quality electricity.

Is South Sudan a sustainable country?

Opportunities and policy tools While the modern energy infrastructure is almost non-existent in South Sudan, the country is endowed with rich sources of sustainable energy. Hydropower capacity alone is estimated at 5,583 MW. Major sites of hydropower are located on the Nile, including Fula, Bedden, Lekki, and Shukoli (Liu et al., 2013).

Is oil the right form of energy for South Sudan?

However, oil is not the right form of energy to meet South Sudan's rising energy demand due to (1) high costs (e.g. high costs of fuel and generator repair), (2) sporadic diesel fuel supply, (3) inefficiency and unsustainability and (4) detrimental health impacts on people and environment.
