

Can a virtual energy storage model be used in a microgrid?

Besides, the virtual energy storage model can quantify the adequacy and shortage of flexible resources in the microgrid, and then provide a reference for the cooperative scheduling of interconnected multi-microgrids under the information privacy of microgrid. Yinghao Ma: Conceptualization, Methodology, Investigation.

What is distributed inertia control method for dc microgrid?

A novel distributed inertia control method for DC microgrid is proposed. The virtual battery algorithm is used for steady power allocation. Dual extended Kalman filter algorithm provides batteries' real-time states. The small-signal model is established to analyze the stability.

What is a decentralized and coordinated scheduling model based on virtual energy storage?

The decentralized and coordinated scheduling model based on the virtual energy storage proposed in this paper is constructed as an upper-level central controller and a lower-level sub-microgrid optimized scheduling model, the structural framework of which is shown in Fig. 2.

Why do we need a microgrid?

The power balance between complicated loads like electric vehicles and distributed sources stimulates the urgent demand for microgrid (MG). It consumes locally generated energy, integrates many units into one node, and reduces the complexity of power network configuration.

How does a microgrid model realize decentralized and coordinated scheduling?

The proposed model realizes the decentralized and coordinated scheduling among microgrids through the iterative solution between the lower level optimization model of microgrid and the upper level coordinated scheduling model. The solution process of the model is relatively complex with relatively long computation time.

What is a virtual DC machine (vdcM)?

In DC systems, the virtual DC machine (VDCM) is also derived based on mechanical rotation and armature equations [9, 10]. The relationships between the AC and DC inertia controls are also analyzed. Furthermore, in hybrid AC/DC systems, virtual inertia is introduced through the bidirectional inverter to improve system stability [12, 13].
